

SEWAGE

P.V.C. SYPHONIC SEWER

This P.V.C. sewer is placed on the roof to collect the rainwater. It has two parts: the float cup or inferior part has a perimeter wing to its support, on which overlaps the waterproof sheets and it is connect to the down-pipe; a vent is the top, and it is concentric with the float cup drainpipe what forms the siphon.

The float cup should be isolated to the structure, in this case with the slab.
